Red Panda Habitat

A red panda is a mammal that loves bamboo.
They live in Asia and in snowy forests. In the forest
there are logs and trees with grass to cover the
soil. They also have lots of bamboo to eat for dinner.
When they need to hide they go to hide in trees
because there are lots of trees in the Himalayas.

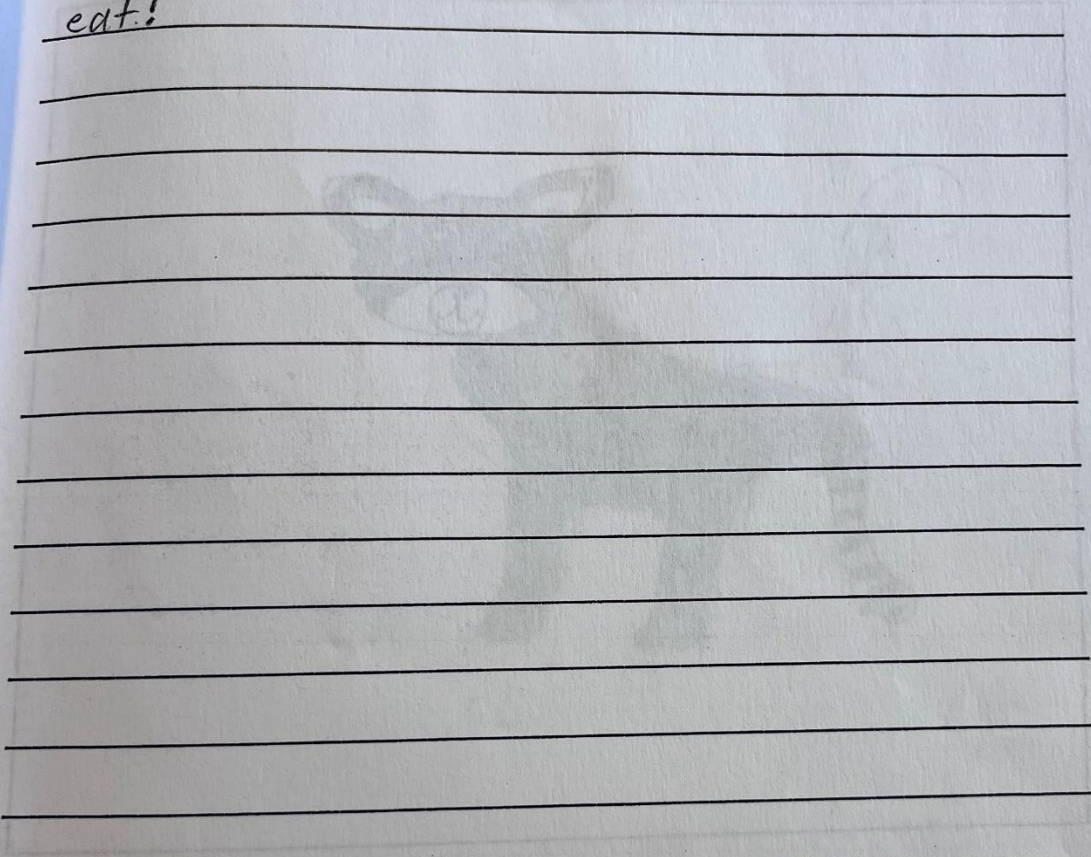

Behavioral characteristics

Red Pandas are alert and active. When they are scared, they run up the trees to hide. When they want to sleep, they sleep different way. They dangle their legs when it is hot outside. When they are very cold they curl up in a ball to sleep. But they mostly rest and eat bamboo. They can eat bamboo sitting.

Structural Characteristics

Standing, and lying on their back. They love to eat!

Red Pandas are very colorful animals. Their fur is dark red around their body. Their tails are striped and much longer than their bodies. The fur around the eyes is black. Red Pandas have a very long tail and a long tail.

Structural Characteristics

inches long. Their body without the tail is
inches. They have retractable claws
that help them grab bamboo.

• Red Pandas are very colorful animals. Their fur is dark red around their body. Their ears, striped tail, and mouth have white fur around them. They also have black eyes and the markings around the eye are also black. Red Pandas have a very long tail and body. Their tail is 12

Diet

inches long. Their body without the tail is 24 inches. They have retractable claws that help them grab bamboo
